Cheatsheet: Introduction to JavaScript Development

JavaScript Tag and Terminologies	Description	Code Example
<script></td><td>Used to include the required JavaScript code in your HTML document.</td><td><pre><body></td></tr><tr><td><script src></td><td>Used to link the required JavaScript files in your HTML document.</td><td><script src="script.js"></script>		
var	var is a keyword used to declare variables.	var num1=10; var num2=11;
var & Scope	var has functional scope, allowing variable to be accessed within function only.	html <html lang="en"> <head></head></html>
let	let is a keyword used to declare variables.	<pre>let num1=20; let num2=21;</pre>
let & Scope	let has block scope, allowing the variable to be limited to the block, statement, or expression in which it is defined, preventing redeclaration within the same scope.	html <html lang="en"> <head></head></html>
const	const is a keyword used to declare variables.	<pre>const employeeId=120; cont employeeId=121;</pre>
const & Scope	It creates a constant whose value cannot be reassigned or redeclared.	<pre><!DOCTYPE html> </pre>
Arithmetic Operators	Arithmetic operators perform mathematical calculations like addition, subtraction, multiplication, division and modulus.	<pre>let x = 15; let y = 3; let sum = x + y; // Addition console.log(sum) //the answer is 8 let difference = x - y; // Subtraction console.log(difference) //the answer is 2 let product = x * y; // Multiplication</pre>

about:blank 1/6

2/20/25, 11:20 PM about:blank

```
console.log(product) //the answer is 8
                                                                 let quotient = x / y; // Division console.log(quotient) //the answer is 8
                                                                 let remainder = x % y; // Modulus
                                                                 console.log(remainder) //the answer is 0
                                                                 let b = 7;
                        Comparison operators compare
                                                                 let isEqual = a == b; // Equality
let isNotEqual = a != b; // Inequality
let isStrictEqual = a === b; // Strict equality
Comparison
                        values and return true/false
Operators
                        based on the comparison.
                                                                 let isGreaterThan = a > b; // Greater than
                                                                 let hasPermission = true;
                                                                 let isMember = false;
                        Logical operators combine
                                                                 let canAccessResource = hasPermission && isMember; // Logical AND
Logical Operators
                        multiple conditions and return a
                                                                 let canViewPage = hasPermission || isMember; // Logical OR
                        boolean result.
                                                                 let isDenied = !hasPermission; // Logical NOT
                                                                 let x = 10; // Assigns the value 10 to the variable x x += 5; // Equivalent to x = x + 5
                        Assignment operators assign
Assignment
                        values to variables. For
Operators
                                                                 x = 5; //Equivalent to x = x + 5
                        example, =, +=, -=.
                                                                 let count = 5;
count++; // Increment count by 1 (count is now 6)
                        Unary operators act on a single
Unary Operators
                        operand, performing operations
                                                                 count--; // Decrement count by 1 (count is now 5 again)
                        like negation or incrementing.
                        typeof operator returns the data
                                                                 console.log(typeof(num1)); //the awnswer is Number let name = 'John';
typeof Operator
                        type of a variable or expression
                                                                 console.log(typeof(name)); \ //the \ awnswer \ is \ String
                        as a string
                                                                 let age = 25;
                                                                 if (age >= 18) {
                        The if statement is used to
                                                                 console.log("You are an adult.");
                        execute a piece of block code if
if Statement
                                                                 } else
                                                                 console.log("You are a minor.");
                        the given condition is true.
                                                                 <!DOCTYPE html>
                                                                 <html lang="en">
                                                                 <head>
                                                                     <meta charset="UTF-8">
                                                                     <meta name="viewport" content="width=device-width, initial-scale=1.0">
                                                                      <title>Document</title>
                                                                 </head>
                                                                 <body>
                                                                     <script>
                                                                          let Seasonmonth = 'March to May';
                        It allows you to test multiple
                        conditions sequentially. If the
                                                                          if (Seasonmonth == 'March to May') {
                        condition is true then it will
                                                                              document.getElementById("seasonmessage") = 'It is spring season';
else if Statement
                        execute if statement block
                                                                          else if (Seasonmonth == 'June to August') {
                        otherwise execute else
                                                                              document.getElementById("seasonmessage") ='It is summer season';
                        statement block.
                                                                          else if (Seasonmonth =='September to November') {
    document.getElementById("seasonmessage") = 'It is autumn season';
                                                                          else {
                                                                              document.getElementById("seasonmessage") = 'It is winter season';
                                                                      </script>
                                                                 </body>
                                                                 </html>
                                                                 const temperature = 30;
                                                                 const isRaining = true;
                                                                 if (temperature > 30) {
                                                                   if (isRaining)
                                                                     console.log("It's hot and raining. Stay inside.");
                        This statement allows you to
                                                                   } else {
                                                                     console.log("It's hot, but not raining. Enjoy the sunshine.");
                        test multiple conditions and
Nested if else
                        execute different blocks of code
Statement
                                                                 } else {
                        based on the results of those
                                                                   if (isRaining) {
                        conditions.
                                                                     console.log("lt's not so hot, but it's raining. Take an umbrella.");
                                                                   } else ·
                                                                     console.log("It's not hot, and it's not raining. Have a nice day.");
                                                                   }
                                                                 let month = "December";
switch Statement
                        The switch statement is used
                                                                 switch (dav) {
                        for multiple conditional
                                                                     case "December":
                        branches, allowing the
                                                                          console.log("It's Christmas month.");
                        execution of different code
                                                                          break;
                                                                     case "November":
```

about:blank 2/6

```
console.log("It's Thanksgiving month");
                       blocks based on the value of an
                                                                        break;
                       expression.
                                                                   default:
                                                                       console.log("It's a regular month.");
                       The ternary operator is the
                                                               let age = 20;
                       simplest way to write
Ternary Operator
                                                               let canVote = age >= 18 ? "Yes" : "No";
                       conditional statements such as
                       if else condition.
                       A for loop is a control structure
                                                               for (let i = 1; i <= 5; i++) {
                       that allows to execute a block
                                                                   console.log(i);
for loop
                       of code repeatedly for a
                       specified number of times until
                       a particular condition is met.
                                                               let limit = 50;
                                                               let a = 0;
let b = 1;
while (a <= limit) {
                       A while loop is a control
                       structure that allows to execute
                                                                   console.log(a);
While loop
                       a block of code repeatedly as
                                                                   let temp = a + b;
                       long as a specified condition is
                                                                   a = b;
                       true.
                                                                   b = temp;
                                                               }
                       A "do...while" loop in allows
                       you to execute a block of code
                                                               let roll = 1;
                       repeatedly as long as a
                       specified condition is true and
                                                                   console.log("Rolled a " + roll);
do while loop
                       guarantees that the code block
                                                               } while (roll < 7);
                       will execute at least once, even
                       if the condition is initially
                       wrong.
                       Function is a reusable block of
                                                               function sayHello()
Function
                                                                 console.log("Hello!");
                       code that can be defined and
Declaration and
                                                               } //function declaration
                       executed as many times as
                                                               sayHello(); //function call

                                                                            return message; // Returns the product of a and b
                                                                        document.getElementById('showmessage').innerHTML = multiply('Hard work is the key');
                                                                   </script>
                                                               </body>
                                                               </html>
                                                               function outerFunction() {
                                                                 const outerVar = "I am from the outer function";
function innerFunction() {
                       A function closure in
                       JavaScript allows a function to
                                                                   console.log(outerVar); // innerFunction can access outerVar
                       access and remember variables
Function Closure
                       from its outer scope even after
                                                                 return innerFunction;
                       that scope has finished
                                                               const closure = outerFunction();
closure(); // This will log "I am from the outer function"
                       executing.
                       Function hoisting means that
                       function declarations are
                                                               sayHello(); // This works even though the function is called before it's declared
                       moved to the top of their
                                                               function sayHello() {
Function Hoisting
                       containing scope during the
                                                                 console.log("Hello!");
                       compile phase, allowing them
                       to be used before they are
                       declared in the code.
                       Function expressions where a
                                                               greet(); // This will result in an error
Function Hoisting
                                                               const greet = function() +
